Novel proteins useful as diagnostic markers particularly for prostatic cancer. and therapeutic targets,

Disclosure; Page 22; 83pp; English

Sequences AAY58198-Y58200 represent synthetic peptides that correspond the extracellular regions of STRAP-1 (serpentine transmembrane antigen off o

the prostate, AAY58194). These peptides were used to raise monoclonal anti-STRAP-1 antibodies. STRAP-1 is the prototype member of the STRAP family of proteins (AAY58194-Y58197) which exhibit a high degree of

STRAP-1 is thought to be a type IIIa membrane protein cc and is expressed predominantly in prostate cells in normal human tissues. Structurally, STRAP-1 is a 339 amino acid protein characterised by six transmembrane domains and intracellular N- and C-termini, suggesting that it folds in a "sexpentine" manner into three extracellular and two cc intracellular loops. STRAP-1 mRNA and protein expression is maintained at high levels and throughout all stages of prostate cancer. STRAP-1 mRNA cr and/or protein is also overexpressed in certain other cancers, including bladder, colon, pancreatic and ovarian cancer. The function of the STRAP proteins is not known. They may be ion channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) or gap-junction proteins (from immunhistochemical staining). STRAP-1 and STRAP are cell-surface tumour antigens. Immunisation with a STRAP capenessing cells. STRAP proteins may be used to identify specific-binding agents, to produce anticoncer vaccines and to generate specific monitoring of cancers (or susceptibility to cancer), as therapeutic cancer nucleic acids may be used for detection, prognosis, and concleic acids may be used for identifying STRAP-expressing cells created in the cell surface, they are easily targetted by systemically administered agents. For identifying STRAP-expressing cells for screening inhibitors of STRAP expression and for therapeutic on prostatic epithelial cells, agents targetted to them should have minimal side effects on other tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

CC comprises administering a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP in a patient. CC patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, composition to the patient. Treating a composition to the patient and comparises administering to the patient a comparise composition to the patient a comparise that comprises the comparise that the variable domains of the heavy and light chains of the monoclonal antibody that comprises the comparise that the vactor delivers the comparise that the vactor delivers the comparise that the vactor delivers the congle chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed intracellularly. The present sequence is extracellular loop of STEAP-1 comparison is located on chromosome 7p22.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Complements of the 1230 open remarked traines between the movel set of probes. Also included are a microarray comprising the novel set of probes call the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the carray; identifying exons in a eukaryotic genome, comprising (a) contacting the each probe of the eukaryote; and (b) detecting specific hybridisation of detectably collection acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single comprising one of 12011 sequences, mentioned in the specification, or encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD) familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histocytosis, lymphangioletomyomtosis, pulmonary alveolar proteinosis, Karagemer syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                       The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          STEAP-1; six transmembrane epithelial antigen of the prostate; caccer vaccine; delineation; cytogenetic abnormality; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                           STEAP-1-related protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2003-313240/30.

                                                                                                                    The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1

                                                                                                                                                                                                                                                                                                                             The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
     STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the chromosomal region that the chromosomal region that the chromosomal region that the substant of human six transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 255 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising a substance that modulates the status of a STEAP-1-related protein, useful for treating and detecting cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition comprising a substance that modulates the status STEAP-1-related protein, useful for treating and detecting cancer

     The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAD-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
epithelial antigen
                                                                                                                                                                                                                                                                                                                                                        Example
                                                                                                                                                                                                                                                                                                                                                                                                              STEAP-1-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2003-313240/30.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                     The invention describes a composition comprising a substance that modulates the status of a protein [1] of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                   Sequence 258
                                                                                                                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                     New composition comprising a substance that modulates the status of a STEAP-1-related protein, useful for treating and detecting cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STERAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STERAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               06-SEP-2001; 2001US-0317840P.
